HUMAN MONOPULSE PLASMOGRAPHY

Edited by Prof. V.M. Inyushin

This work represents some results of experimental research of human bioenergetics, obtained by the monopulse plasmography method. The most peculiar point of the work is the study of anomalous fast-flowing processes, inaccessible for visual control by the other means of technical registration. These results not just visually show the complexity of the processes, occurring on bioenergetic level, but also start a new trend in the research of energy-informational interactions, including the distant ones. To make the facts stated below sound popular and understandable to a large range of readers, not only to the specialists, it is necessary to give some brief explanations.

1. Recently the bioenergetic rehabilitation practice, based on experience and medical notions of the Ancient Orient, has been gaining authority and becoming more and more recognized in medicine. The idea of homogeneous moving force of the universe is typical of ancient orient philosophy. Chinese culture is centered round the vital energy **chi**, ancient Indian culture – round high-purity life-giving breathing *prana*. In either case this is a universal, fundamental vital energy, which, according to the ancient notions, exists both in macrocosm and microcosm –in a human-being. The **chi** energy (in compliance with ancient Chinese terminology) exists in the environment as *external chi* and as *internal chi energy* – in the human organism. The *internal chi energy* circulates in the human organism via numerous canals, customarily named meridians. The so-called vital points (biologically active points – according to the modern terminology) go along the meridians on the body surface. Through these points the energetic interchange of the human organism with the environment is implemented. In addi-

tion, the twelve main meridians are supposed to carry out the “energy supply” of the principal vitally important organs and functional systems of the human organism.

Thus, the human health is wholly determined by the harmonious energy circulation via the meridians and by its balanced interchange with the exterior energy of the environment. In this regard the problems of control of the patient’s energetics condition again find significant value both in the process of diagnosing and in the process of treatment. These also become very important with a view of prophylaxis.

The control of bioenergetic situation condition, its visual control is provided by the methods of plasmographic testing, which are based on the use of the “Kirlian effect”.

2. The kernel of the “Kirlian effect” is the following. It is known that high intensity electric field (corona discharge field) evokes the luminescence of objects, located in the zone of this field’s active influence. The fluorescence is caused by the reaction of plasmas body of the investigated object, and for biological objects – this is the *bioplasma* reaction, on the influence of high intensity field. If the tested object is put on photographic film, the radiant energy of corona discharge plasma will make a photographic imprint on the film. ***This imprint includes a set of information about the bioplasma state, which, in fact, explains the picture of bioenergetic situation of the organism.*** Hence, by some investigators such techniques are known as Kirlian photography, by the others – electronography. We consider that the term “plasmography” should be used, determining the kernel of the method more thoroughly and accurately.

The experiment shows that, estimating the inanimate nature objects, the sizes and distribution of the streamers of corona fluorescence are generally conditioned by the physical parameters: material, its electroconductivity, environmental factors and others, and also by the given parameters of exciting voltage. An animate object amends the plasmas structures of corona discharge: localization of streamers, their intensity, configuration, etc. This phenomenon has been carefully studied, approved, meaning the indication of pathological processes,

and described by V.Inyushin, V.Adamenko, P.Mandel, K.Korotkov and by the other researchers. The diagnostics of pathologies is held by the plasmographic imprints of fingertips and toe-tips of a patient.

3. To receive corona discharge field, entailing the fluorescence of the investigated object, several variants of excitation modes are practiced. Most of the scientists prefer usage of the multi-impulse excitation mode (sometimes called high-frequency mode) which gives an opportunity to apply low photosensitivity photographic materials and to work with photographic paper directly.

However, to reduce the effect of measuring process over the investigated object, particularly, over human bioplasma, which determines the state of human bioenergetic system, it is necessary to minimize the influence of exciting electric field. This is possible at the expense of the measuring current decreasing and the stimulation time reducing. Therein, the use of excitation mode by single pulse may be supposed to become optimal. Monopulse mode is more sparing, and here its indubitable advantage lies.

No doubt that monopulse mode has its certain disadvantages: it requires the application of expensive high-speed photo films, such as X-ray or radiographic films, which is a valid deterrent for the explorer now. But this is another side of the problem.

The second advantage of monopulse mode lies in the fact that it gives a unique opportunity to enter the world of subtle energetic, fast-running processes and effects. At this point we should focus attention on the question of “what are we actually photographing” and make things clear.

First of all, certainly, we take interest in the fingertips of a patient, their luminescence in the corona discharge field. We are all aware of their informativeness with respect to the control of bioenergetic state. Nevertheless, the whole nearby space is exposed to the corona discharge field, and, hence, ***all the objects found in the zone of action of the field*** are affected by it. Moreover, without fail all these objects react somehow upon the influence of high-intensity field. It is quite natural that after the effect of the very first impulse, the energy-

informational situation in the investigated space changes, and each stimulus coming next produce extra distortions concerning the initial condition.

The method of multi-impulse plasmography gives a total picture, i.e. a number of images got as a result of each impulse's individual effect is stamped on the photograph. This total picture, as proved by the practice, reflects the bioenergetic state quite satisfactorily. Still, the image of the genuine initial condition, all the subtle material substances and formations, typical of it, dynamics of their behavior, and also energy-informational development taking place on the field level – all these effects are disclosed and destroyed by plenty of the driving pulses, all these phenomena remain out of the investigator's sight. To notice the subtle material formations, to fix the fast-flowing energetic processes on the photographic film – the monopulse plasmography helps to realize these.

For many years, in Kazakh State University, at the Biophysics department under the supervision of professor V.Inyushin the bioenergetic exploration of the phenomenon of human extrasensory developments has been led. Sincere interest in paranormal effects, high professional level, proper and respectful relation to the phenomenon and to people, who have come into contact with this phenomenon – all these circumstances create beneficial basis for carrying out the research work and for the flow of people, willing to “check their extrasensory resources”. The research usually starts with the plasmographic control of bioenergetic situation.

After numerous experiments it was empirically proved that the corona luminescence of a healthy person's fingers has an integral picture, without considerable fractures; the streamers are wavy, approximately equal in length and distributed evenly over the perimeter (photo 1,2). These are signs of successful bioenergetic situation. Unfortunately, in practice we observe a totally different picture.

A lot of people, having felt some anomalous effects about themselves, which, as a rule, have led them to the necessity of “healing”, turn to our department. Almost all of them consider themselves to be extrasensory individuals and healers, many are contactors. There are no strict limits here, though. Usually

plasmographic indication shows disruption of their bioenergetic situation, and, as a matter of fact, this is the reason of their bent for bioenergetic contacts via the so called “healing” (photo 3-5). All the disruptions of the integrity of corona fluorescence signify the bioplasma emission breakings, which lead to various pathologies.

Just for six recent years we have examined more than two thousand people: men and women, children and the elderly. The analysis points out that firstly the energetics of meridians, imaging the psychological condition, deforms. Sometimes, even quite often, there are additional anomalous plasmous structures against the background of the deformed energetics.

The plasmous structures often arrange rows (photo 6,7) or ordered assemblages in the zone of corona discharge (photo 8-10) and out of it (photo 11-13). Occasionally, these plasmous formations are larger in size (photo 14,15). Under quite intense magnification provided, their plasmous nature is clearly browsed (photo 16,17), the cores of plasmoids are wrapped up in a luminescent cover, most likely, of ionized gas (photo 18).

To test the version of manifestation of the accidental electrostatic discharges the special worked out control experiments were realized, which finally failed. This version was justified neither with the help of a glass stick, rubbed by cloth, nor with the aid of a high-voltage electrospark discharger, nor by some other means. It is quite possible that these plasmous structures are emitted from the inside, appear as a result of destruction of subject’s psycho-energetic matrix and, in fact, are fragments of its disintegration. It makes no secret that, after all, such people are often on the verge of nervous breakdown, get to clinics as patients, and this spicy detail causes serious difficulties to the research work.

Here is a particular example (photo 19). Left photograph shows plasmographic imprint of a contactor’s finger, being in a calm condition, right – at the moment of “establishing contact”. So, we notice the process of disruption of the corona fluorescence integrity and emergence of bioplasmodoids.

However, the possibility of other variants concerning the nature of formation of these plasmous “scattering” is not excluded. Here are another two exam-

ples, rather interesting from our point of view. The first case indicates the moment of plasmoids' emergence resulting the destruction of some substance, which is near the finger by the time of shooting and which is likely to be that very "construction material" (photo 20). This fact gives rise to assume the probability of the version of the plasmous formations' "alien" nature. The second case reveals plasmoids, emanating from one point together with the exit of bioplasma streamer (photo 21). This case suggests an idea that various manifestations may have their peculiar features.

Sometimes the plasmous formations leave striking traces and tracks, rather ample, in addition, which fact enables to mention their high energetic potential (photo 22-26).

It is characteristic that the manifestation of this phenomenon was most actively observed in 1991-1992, at the leaving peak of solar activity. Let us stress here that such manifestations were posted even earlier, but were judged as artefact, and, therefore, did not get their due attention. At the present this phenomenon appear quite seldom.

The deformations of fluorescence of corona, looking like a sign of a spreading drop outwardly, are of a considerable interest. Most often these deformations occur in the zone of the contact of a finger and a photographic film, and they can be explained by the presence of some structures or formations at that place (photo 27-30). Found on the way of the bioplasma streamer, they prevent from its passing (photo 31,31a). As long as these structures show their worth by the luminescence – consequently, they possess electro-capacity, which fact emphasizes their material nature. It is worth mentioning that such manifestations do not take place at the second photographing. Probably, they immediately collapse under the effect of the very first impulse or instantly vanish away. But in either case there comes a good question: why do these effects occur nearby our fingers, at the very place where the energetic canals run in and out? Do they parasitize on our energetics?!. (Photo 32) Gazing at this picture one can hardly think of any possibility of chance. And here it is appropriate to recall the extra-sensory individuals who shake up their hands frequently and thoroughly during

their work with a patient. Are not these *that very plasmous parasites*, catching on their fingers?

There is a particular example. 38 years old woman is on the books at psycho-neurologic dispensary, physical state – emaciation. Diagnosis... let diagnosis remain a medical secret. We will just view her bioenergetics condition (photo 33).

...Here he is, the culprit of her torments, he who “is sucking her blood”, i.e. her bioplasma, thus destroying the energetics together with the mind (photo 34). Talks over the “energetic vampirism” really resemble the truth and are not just a fantasy in one’s spare time...

Of course, you have all the power to blame the author with his emotionalism and with the haste in bringing such a drastic “verdict”. Well, there are no objections, but there are arguments. After the intercourse with the transmitters of such phenomena, feeling discomfort and lethargy, the author has fixed time and again the emergence of these alien “unbidden guests” on the plasmographic imprints of his fingers. Fortunately, the author has the opportunity to control his bioenergetic situation permanently and in case of need he is able to take the appropriate prophylactic measures in time.

The idea of diversity of forms of life in the universe is not new. In his time Tsiolkovsky confirmed the concept about the substances of plasmous nature living in the world around us. Academician V.Kaznatcheev mentions non-biological, field forms of life. And here are the photographs. The point is that the practical acquaintance with these very “diverse forms” is likely to have happened. Surely, all these facts need to be carefully worked out: studied and proved, contested and doubted upon, in short – investigated. I would also like to stress here that the method of monopulse plasmography provides a unique opportunity to penetrate deeply into the invisible world of subtle energetic interrelations, literally, to find and to see its “inhabitants” and the signs of their manifestations. By the way, before the invention of magnifying lens people could only guess about the viruses and other microscopical life. Although the plasmous formations we are talking over are not so small in size, are inaccessible to com-

mon vision, too, in view of their material density, but they show their worth by the glow in the field of corona discharge. They are sometimes rather large in sizes (photo 35) and often exceed the bounds of a shot (photo 36-38). So, here come questions, and quite a lot of them.

Certainly, it is a pity that we can not take this “plasmographic view” of all the space around us. To our regret we do not yet have volumetric Kirlian photography technologies or other devices of volumetric vision of such manifestations, effective enough. There is just a projection or rather some kind of a partial cut of space, limited by a film’s sizes in addition, in our eyeshot. We work with a maximally economical format 75×133 mm. It is necessary to watch these structures as a whole – in all length and width, in total size (volume). So, even now the paramount objective – finding out approaches to volumetric photographing – is becoming clear. In this connection we have made an attempt of “layer-wised” photographing, used a peculiar “plasmographic tomography”. And the very first experiments produced amazing result!.. But first let us refer to one more phenomenal manifestation, discovered in the process of our research work.

By the present moment our archives contain many, more than one thousand plasmographic imprints of fingers of people who passed our checkup, and, as mentioned above, several specific manifestations against the background of the deformed energetics are not rarities. Quite natural is that we analyze, classify, group them and so on. Let us view some photographs from one of such groups (photo 39-44). All of them have one characteristic feature: the oppression of streamers’ corona takes place against the background of additional “phantasmal” (conditional term) formations. Furthermore, the most important thing is that these “phantasmal” structures are *fixed on the reverse of a photo film*.

It is necessary to explain here that the X-ray film used by us is double-sided, which means that it has a photosensitive emulsion coating applied on both sides. On the obverse (upper) photo-film side, where the fingers are put, the *area corona discharge* actually passes (“runs”), stimulating the picture of streamers’ distribution. This picture, in its part, depends on the fingers’ electro-capacity and the bioplasma condition. This is the very plasmographic “portrait” of energetics

state. “Phantasmal” luminescence always develops on the reverse of the film, and this fact put us on our guard.

Initially a version was raised about the potential moist, aerosol discharges out of the fingers, appearing together with high nervous-psychic reaction, stimulated by the impulse of high-intensity field. By virtue of its rationalism, this version is undoubtedly attractive, but the fact of fluorescence viewed on the reverse of the film calls the version in question. Experimental photographing in rubber gloves removed all the doubts in this respect and “destroyed” the version finally. The experiment proved that in rubber gloves the phenomenon occurs the same way as without them. At the same time the experiments with deliberate moistening and watering of fingers were carried out. They gave the supplementary proves of groundlessness of all these “moist” undertakings.

Nonetheless, judging by these photographs (there are much more of them in reality) a pre-conclusion may be drawn or, at least, the following fact may be stated: the brighter the phenomenon of “phantasmal” glow is, the more oppressed and deformed the bioenergetic situation of the organism becomes.

Here is another observation. Possibly, many people faced an occasion when an extrasensory individual tells a patient that he (a patient) has “all the canals plugged”.

And now a question raises: is not it that very “phantasmal” substance which has “plugged” all the canals – energetic meridians? If yes, then immediately comes the next question: why does the substance acts in that way?.. However, a supposition about the parasitizing formations has already been mentioned by us (photo 45-47).

Numerous experiments, carried out by us, demonstrate visually and clearly that the energetic system, burdened by such a specific ailment, requires bioenergetic rehabilitation. This may be laser activation, manual bioenergetic correction, etc. Sometimes, probably, having slight affection, the bioenergetics rehabilitates quickly. Occasionally, the alien substance disappears after the first photographing right away. It is significant that the second hand is being purified at that, either. But more often happens otherwise.

Let us analyze the concrete case when the parasitizing mass (keeping on developing this idea) is inculcated “deeply” and “densely”.

Young man, 20 years old, a student, goes in for sport (body building) actively and purposely, in one word he is a “muscleman”. Such men are also called the “strapping lads”. Diagnosis... There is no diagnosis, just... suppositions... Has not consulted doctors. Fair, insomnia, inner anxiety – what are these complaints for him, for such a “husky fellow”?

And now let's have a look at the plasmographic “portrait” of the young man's energetics (photo 48). Clear absence of the corona fluorescence has proved the validity of his anxiety straight off. The energetics of the young man is totally blocked, and this fact is obvious. There are all the arguments to assume that his energetic canals are really “plugged up” by the alien parasitizing substance. It is necessary to make bioenergetic rehabilitation – “cleaning” of the bioenergetic system, and check the results of plasmographic examination.

After the very first procedure of bioenergetic stimulation the process of treating starts. From the beginning we study the reaction of the excited alien substance (photo 49,50). However, the bioenergetics still remains blocked up. But, after the third stimulating effect, we see the emergence of the first streamer of incipient luminescence corona under the forefinger. This means that the energetic canals start opening up (photo 51). Few more procedures –and the canals are cleaned out, the energetics has “joined the work” (photo 52).

Here, again, we focus your attention on the version of the superlight living substance, parasitizing on a person's energetics, and the example of experimental checkup, mentioned above, presents conclusive proofs for it.

We will refer to the other experiment, which main point is the evaluation of this alien substance's capacity for passing from one individual to another. The role of “another individual”, that is of the parasitizing substance “receiver”, in this experiment is, naturally, given to the author. Before starting the experiments I am taking a picture of my energetics (photo 53). Now we may start.

The experimental program varies in the interval from the long distant psycho-energetic interactions to a direct contact. The energetics condition of the ex-

periment participants is monitored on each stage. An example of a close distant interaction investigation (initial stage) is showed on photo 54. After a two-minute contact the donor's "phantasmal" substance has "migrated" into the experimenter's fingers and his energetics has got rather a sad state (photo 55). The experiment has demonstrated high lability and virulence of this alien parasitizing substance, such a peculiar psycho-energetic "infection". Indeed, "bed examples are catching". It is also worth mentioning that such an "infection" occurs even having more remote distant interactions.

And, nevertheless, the problem of genesis of this alien parasitizing substance remains unsolved. The same mystery lies in the question: how does this substance (or, perhaps, just its reflection?) appears on the reverse of the photo film? All the notions about its "hyperfinesness", "superpenetrating" and other "superfeatures" still keep being unproved, in spite of such a persuasive and vivid experimental confirmation. However, an idea of layerwise plasmography has been born during these experiments. Not going into technical details of the realization of this idea, let us refer straight away to the results of monopulse plasmography, stated in two levels (photo 56a, 56b).

The first case shows us the known picture of bioenergetic situation, oppressed by a "phantasmal" substance. The second photograph, that is photo film placed in some distance from the fingertips, fixes a picture of pronounced energetic interactions, arising distantly on the field level – a peculiar cut of energetic streams. As a matter of fact, we have observed what we had expected to observe: energetic manifestations of the field nature. The forthcoming experiments revealed that this phenomenon becomes apparent always if a patient's energetics is oppressed by a "phantasmal", parasitizing substance. Here is another example of registration of such a "phantom presence in two levels" (photo 57a, 57b).

Now it is obvious that the development of a "phantasmal" parasitizing substance on the reverse of a photo film is conditioned by the field nature of the phenomenon. And here, evidently, it is time "to move aside the screen" and say in open words: that young "husky fellow", in good physical health, went to us and not to the doctors because of one thing: he was sure that he had been *put an*

evil eye upon. And many other visitors come to us anxious about the “evil eye” and spoiling.

To put an evil eye (on/upon somebody) (*to overlook, to put off*). 1. In superstitious presentations: to inflict harm by evil eye, malevolent glance. 2. To bring disaster upon somebody by praise or prediction of something good.

Spoiling. In folk superstitions: disease of sorcery.

(*S.Ozshegov. Russian language dictionary*)

Numerous results of patients’ examinations, worried about the problems of such “folk superstitions”, visual plasmographic control of their bioplasma state unambiguously uncover the reality and justifiability of the problem, which obviously transgresses the bounds of the “superstitious ideas”. However, to our mind, we should not “look for the guilty elsewhere”. The reason comes out of different religious and philosophic views. Without doubt, this question is complicated and many-sided – its roots go deeply into the problem of bioplasmic structures, world of subtle energetic effects and interactions. Let us view one more plasmographic imprint of the energetic situation, developed distantly on the second level (photo 58). The picture itself (its imprint in the emulsion layer of the photo-film) is, undoubtedly, a result of the radiant energy of ionized particles of air. But the structure of the image is possibly conditioned by the correlation of the “directed” informational fields and the energetic streams (prana), typical of the investigated object at the present moment (photo 58a, 58b). We come to a notice that different fingers have different structural organization of the fields. And we do remember that various meridians are supplying various organs with the life-giving energy...

Via these photographs even an unsophisticated of the “orient mysteries” person catches an idea of the deepness of penetration of the orient folk medicine into the secret intricacies of human energetics, into its innermost bosom. The ancient Tibetan-Chinese medical and sanitary **Show In**’ system (is translated as “an imprint of a hand”– A.Kuzmin) is sure to be referred to as an example. With the aid of special techniques of fingers-linking, polished up by a century-old experience, streams of **chi** energy are redistributed through the meridians – in this way

the system provides with the attainment of medical and sanitary effect and with the mastering of spiritual experience. The Indian yoga culture knows these techniques in the term of **mudri**. It also does not give rise to doubts that these truly wise systems did not pay attention to the problems of “folk superstitions” (evil eye, spoiling, energetic vampirism) and of everything else, bearing any connection to the energy-informational processes, occurring in the human organism.

Concluding our brief survey, we would like to indicate one more plasmographic imprint, demonstrating how distinct the energetic streams of different fingers of one and the same hand may be (photo 59). With this picture we would be pleased to emphasize the profundity and perspicacity of the orient medical and philosophical views, to stress the urgency of the bioenergetic rehabilitation question and, finally, to demonstrate the new opportunities and opening prospects of monopulse plasmography.

Photo 1. Plasmographic imprint of the hand-fingers of a healthy person. An example of fine balanced bioenergetics.

Photo 2. The fluorescence corona with no considerable visible fractures, the streamers are about one size, distributed evenly along the perimeter.

Photo 3. Slight disruptions of the fluorescence corona integrity.

Photo 4. This picture points out considerable disruptions in bioenergetic system.

Photo 5. An example of extremely oppressed bioenergetics. The bio-plasma emission is practically entirely lacking.

Photo 6. The rows of plasmous structures in the zone of corona discharge. 18.12.91.

Photo 7. Layers abundant in plasmous structures.

Photo 8,9,10. Ordered groups of plasmoids in the zone of corona discharge. Magnification x2. 1991-1992.

Photo 11,12,13. Plasmous rows and agglomerations outside the corona luminescence. August, 1992.

Photo 14,15. The plasmoids' dimensions, viewed practically, sometimes reach a few millimeters.

Photo 16, 17. The plasmous nature of these formations is clearly viewed under a necessary magnification. (Magnification x7)

Photo 18. The nucleuses of plasmoids are wrapped up in a cover of ionizing gas.

Photo 19. The contactor's ring-finger plasmography: left – in a calm state, right – at the moment of “contacting”. 7.12.91.

Photo 20. The process of plasmoids' emergence as a result of destruction of a certain substance, located near the finger.

Photo 21. Outflow from one point and the group of plasmoids, and the bioplasma streamer.

Photo 22. The fly-over of a plasmous body, decomposing into small fractions.

Photo 23. Sometimes the plasmous structures leave striking tracks. 17.12.91.

Photo 24. A single track in the zone of the corona discharge fluorescence. 17.01.91.

Photo 25. Fly-over of a single plasmoid. 9.10.93.

Photo 26. The tracks of active response of the plasmous structures.

Photo 27-30. Examples of the “subtle-material” alien formations' registration near the fingers.

Photo 31. An alien, subtle-material body on the way of a streamer. 11.07.92.

Photo 31a. An alien body obstructs the streamer's passing through. (Magnification x5)

Photo 32. What was it that found itself under the finger at the moment of exposure? And maybe the question is likely to be put in a different way: who was it?..

Photo 33. Seriously damaged, “eroded” energetics of a psycho-neurologic dispensary patient. 15.04.95.

Photo 34. Here he is – the only initiator! And the doctors may not even guess about the destructive processes, taking place on the fingertips of their patients. (Magnification x2,5)

Photo 35. An interesting fact: has this plasmoid already “left” the finger or not yet “reached” it?

Photo 36. Questions here, either: what is it and where does it route to?.. But, judging by the presence of streamers, it is obviously material.

Photo 37. The actual dimensions of the plasmous body are unknown: left outside the shot. On the upper side of the picture just a part of its luminous contour is seen. The process of its partial destruction under the effect of the high-intensity field impulse is clearly viewed.

Photo 38. One more example of the plasmographic registration of a large plasmous structure, unfitted in the shot-frames. An extraordinary light and shade contrast of streamers, possibly conditioned by the specificity of the taking place processes, attracts the attention.

Photo 39. Feebly marked “phantasmal” fluorescence.

Photo 40. Pronounced “phantasmal” formations, agitated by a high-intensity field impulse. 27.11.93.

Photo 41. Occasionally, the “phantasmal” structures have clear contours, as showed in this example under the second and the forth fingers on the left. 3.12.94.

Photo 42, 43, 44. Examples of the energetic situation, oppressed by “phantasmal” formations.

Photo 45. The phantasmal substance is blocking the bioplasma emission, thus oppressing the energetics of the organism.

Photo 46. The substance of these structures is homogeneous and, coming closer, it is gravitating towards a merger.

Photo 47. An example of a merger of the two “phantasmal” formations.

Photo 48. Complete lacking of the bioplasma emission. The bioenergetics is blocked by an invisible alien substance. 17.01.97.

Photo 49. After the first procedure of bioenergetic stimulation the bioenergetic situation remains oppressed.

Photo 50. After the second stimulation procedure the alien substance becomes apparent, starts “going outside”.

Photo 51. After the third procedure of bioenergetic stimulation the first streamers of the fluorescence corona have appeared.

Photo 52. The bioenergetic rehabilitation seance is accomplished. The patient’s bioenergetic system is cleared of the alien substances.

Photo 53. The author’s energetics before the experiment was started.

Photo 54. The distant interaction control. Initial stage.

Photo 55. After a two-minute contact the experimenter’s energetic situation has got a sad state. The experiment has demonstrated the lability and virulence of this substance. 12.02.97.

Photo 56a. The contact plasmography shows a picture of bioenergetics, oppressed by a “phantasmal” substance.

Photo 56b. The same energetic situation’s distant plasmography is posting a peculiar “cut” of the energetic streams. 11.02.97.

Photo 57a. One more illustration of the bioenergetics, oppressed by the presence of “phantasmal” formations.

Photo 57b. On the second level the presence of energetic streams is fixed again.

Photo 58. Energetic streams of the different fingers of one and the same hand may have a totally different organization.

Photo 58a. “Energetics” of the little finger.

Photo 58b. “Energetics” of the ring finger.

Photo 59. “An imprint of a hand”. Four fingers – four different energetic streams. 31.03.97.
