

LIGHT AND CONSCIOUSNESS: EFFECTS OF MULTI-WAVELENGTH INTERFERENCE PATTERNS ON HUMAN STATE

Dr Tom J. Chalko, Melbourne Australia

Introduction

Numerous experiments with bio-electrography (Gas Discharge Visualisation) clearly demonstrate that comprehensive information about human state is encoded in the Light that surrounds the human body. By recording and interpreting limited fragments of this glow (typically around fingertips), accurate physiological as well as psychological diagnostics is possible (Mandel, Korotkov, Milhomens).

Among many others, experiments of Dr Chiang Kanzhen with microwave spectrum of bio-emissions clearly demonstrate that, under certain conditions, the information present in electromagnetic vibration pattern of one living organism can be transmitted to cause physiological and even genetic changes in another living organism.

Above facts suggest that our Consciousness may be holographically encoded in the interference pattern of Light that surrounds every cell of our body.

This article briefly presents results of 3 year research into methods and techniques to influence and control the human state using spectral mirrors, filters and interference patterns that directly interact with human bio-emissions.

Effect of black clothing.

It is quite easy to demonstrate disruptive effects of black clothing to the human state using bio-electrography – see Fig 1 for example. Immediate and significant weakening of the glow is obvious. According to established principles of Kirlian diagnostics (Korotkov, Milhomens) wearing black clothes produces effect that is similar to the effect of stress, depression, lack of energy or sadness.

Fig 1. Effect of wearing black shirt on the skin for 2 minutes. Left – initial state. Shown bio-electrogram of just one finger

Bio-resonance

The goal of the research project reported in this article was to find methods of spectral stimulation that cause repeatable, systematic and coherent improvements to human state as measured by bio-electrography. It was found that:

1. Near monochromatic colours have the strongest positive effect on human state
2. Colours in direct contact with human skin seem to have stronger effect than those perceived by our eyes from a distance.
3. A change of wavelengths is more effective than any particular wavelength.

4. Most effective are certain harmonious multi-wavelength interference patterns containing near-monochromatic reflectors in a wide range of wavelengths – from near infrared to UV.
5. Interference pattern that matches the main chakra frequencies along the human body produces most repeatable, systematic and coherent results.

To meet all of the above criteria simultaneously – multi-wavelength interference patterns were designed and printed on pure cotton fabric. Spectro-photometer was used to select pigments that produced near-monochromatic reflectors at specific wavelengths on the fabric. The fabric was then used to make clothing with specific spectral distribution that matched locations

of chakras (so called “chakra shirts”). Many prototypes and 4 generations of experimental prints were developed and tested.

EFFECT OF BIO-RESONANT GARMENT

Fig.2. Reconstruction of bio-energy intensity from bio-electrograms of 10 fingers using the method of Korotkov.

Fig. 2 presents a typical response of a tired person to a 4-th generation chakra shirt. Care was taken to eliminate any other influences on the person during the test. Results presented in Fig 2 clearly indicate that bio-energy field becomes more harmonious, more coherent and the positive effect accumulates with time. The effect of the coherent change in human bio-energy field in response to tuned multi-wavelength colour stimulation was

called “bio-resonance”.

Bio-electrography was and is frequently used by researchers (Korotkov) to evaluate and compare effectiveness of various therapies, both orthodox as well as esoteric.

Comparing various healing modalities it is quite difficult to find any treatment or therapy, which produces so positive, coherent, systematic, repeatable improvements of the human state so quickly and so effortlessly as the “bioresonant” chakra shirt.

Studies of nearly all ancient civilisations show that traditions of making and wearing extremely colourful garments played an important part in their life. In nearly every folklore on Earth this tradition continues. What seems just a tradition had in the ancient past an important reason, related to the very basis of human existence. Can our science discover and improve principles that ancient civilizations already knew and practiced?

Conclusion

Preliminary studies of the mechanism of colour stimulation point to the direct interaction of the tuned interference pattern used with the information in our subconscious mind - encoded in the electromagnetic pattern of bio-emissions that surround us.
